SUMMARY

Full-stack MERN developer working on production products at a growing tech company — including an established developer API platform with a large user base and a newer static-site hosting and deployment platform. Comfortable owning features end-to-end: REST APIs, database design, authentication, payments, and CI/CD deployment. Also ships independent full-stack projects (Next.js, PostgreSQL, Payload CMS) and is pursuing a BCA alongside professional work.

EXPERIENCE

Junior Web Developer Intern – Webby Wonder

April 2026 – Present

- Maintain and extend CountryStateCity (countrystatecity.in), an established developer API providing structured country, state, and city data to a large developer base — working on endpoints, data integrity, and versioning.
- Contribute to the API dashboard and documentation experience for CountryStateCity's developer users.
- Build and ship features for MakeMySiteLive (makemysitelive.com), a static-site hosting and deployment platform — covering deploy pipelines, versioned rollbacks, and the end-to-end deploy workflow (check subdomain → create site → deploy).
- Designed wildcard subdomain routing and multi-tenant, host-based routing for MakeMySiteLive's site hosting.
- Deployed the Wheelhouse car rental landing page to MakeMySiteLive as a real test case, working through its versioning and rollback system end-to-end.
- Explored platform architecture for MakeMySiteLive, including Cloudflare R2 storage, NextAuth, and Stripe/Razorpay billing.
- Built a Chrome extension (Manifest V3) for exporting WhatsApp chats, plus marketing assets and email templates for product launches.
- Scoped billing integrations (Stripe, Razorpay, Dodo Payments) and cross-product growth experiments between CountryStateCity and MakeMySiteLive.

PROJECT

MakeMySiteLive — Platform & Growth Work

- Built the platform's reliable deploy workflow (check_subdomain → create_site → get_site → deploy_site) using zipped, base64-encoded payloads.
- Designed and built marketing assets across the product suite: GitHub README banners, a LinkedIn banner, CSC dashboard sidebar banners, and social posts for LinkedIn and X.
- Built HTML email templates in two visual styles (dark terminal-style and clean white-card style) for product launch campaigns.
- Deployed a personal portfolio to a MakeMySiteLive subdomain using a terminal/deploy-log aesthetic as a live product showcase.
- Drafted and spam-tested a launch email campaign for ~50,000 CountryStateCity API users, achieving a 9.8/10 spam score before handoff to an ESP for sending.
- Developed a cross-promotion strategy between CountryStateCity and MakeMySiteLive, including contextual doc callouts and hosting a live CSC demo on the platform.

Developer Portfolio

- Built a production-ready full-stack portfolio using Next.js 16, React 19, Tailwind CSS 4, and Framer Motion.
- Implemented a contact form that saves messages to a Neon PostgreSQL database via Prisma 7 and sends email notifications through the Resend API.
- Added a live view counter per project page, backed by the same Neon database.
- Implemented dark/light mode with next-themes and a typewriter hero animation with a hydration fix.
- Set up a full CI/CD pipeline: dev branch → build → PR → merge → automatic Vercel deploy, with branch protection on main.
- Resolved breaking changes in Prisma 7, including switching to the Neon driver adapter and fixing build-time database queries in generateStaticParams.
- Fetches project README content live from the GitHub API on project detail pages.

Personal AI Agent (DevOS)

- Built "DevOS" — Personal AI Command Center, an autonomous agent managing Gmail, Google Calendar, Notion, GitHub, Trello, and Slack, powered by Gemini 2.5 Flash and Groq Llama 3.3 (free-tier APIs, no credit card required).
- Designed a morning digest system where 6 sub-agents run in parallel on a schedule, aggregating results and delivering them to Slack.
- Built an email triage pipeline with P1/P2/P3 priority scoring and auto-generated draft replies with one-tap approve/send.
- Implemented calendar intelligence — conflict detection, focus-block protection, and pre-meeting briefs.
- Built a task sync layer unifying Notion tasks, GitHub PR staleness tracking, and Trello card status.
- Added content generation features: multi-variant LinkedIn post drafts and auto-generated changelogs from merged PRs.
- Built an intent-classification chat layer that routes natural-language commands to the correct service automatically.
- Implemented a persistent memory store that learns the user's voice, VIP contacts, and preferences over time.
- Architected with React 19 + Vite on the frontend and Node.js/Express 5 on the backend, with a smart LLM router that falls back from Gemini to Groq on rate limits.

Car Rental Platform

- Built a full MERN car rental platform covering browsing, booking, and payments.
- Integrated Stripe and Razorpay for payment processing.
- Used Cloudinary for vehicle image hosting and Winston for structured logging.
- Implemented JWT-based authentication.
- Deployed as a Vite monorepo (web/ subdirectory) on Vercel, working through Razorpay's onboarding process.

education

Bachelor of Computer Application (BCA)

Shailendra Education Society, Dahisar — GPA: 6.8

skills

Languages	JavaScript, TypeScript, HTML, CSS
Frameworks/Tools	React, Next.js, Node.js, Express.js, Payload CMS, Git, GitHub, Docker,
Databases	Vercel, Railway, Stripe/Razorpay, VS Code, Cursor
AI Tools/Platforms	MongoDB, PostgreSQL, MySQL
	Claude, OpenAI GPT Suite, LangChain.js
